

DESIGN & ENGINEERING

Octatube's business philosophy focuses on the development of new products, the optimization of synergies between different design disciplines and the integration of the design, engineering, production and installation processes. Bringing these together by means of the so-called Design and Build concept, results in a single responsible and approachable party: Octatube. There are major benefits for the client here, particularly where highly specialised, new or experimental components are concerned.

Novel design concepts, innovative leaps and crisp decision-making are the result of the tight collaborative arrangements and the constant dialogue between the architectural, structural and industrial designers at Octatube. A multidisciplinary approach to design has proved to be an essential element of Octatube's success in delivering new designs. Dreaming and creating, inventiveness and innovation. These are the factors providing the impetus behind Octatube's development of novel components, products and systems.
